

Medical Necessity Reference Guide

WISCONSIN · MARCH 1, 2012

This guide is provided as an informational service to Dynacare accounts. The guide contains certain Local Coverage Determinations issued at various times by the local Medicare carrier and National Coverage Determinations issued by the Centers for Medicare and Medicaid Services. The information compiled herein is as of March 1, 2012. There can be no representation or warranty as to the accuracy or completeness of the information or that use of this information will comply with the local or national policies. To ensure the accurate and appropriate use of the information, it is recommended that the Medicare carrier be consulted. Primary sources (i.e. Medicare carrier publications, notices, and advice) should be consulted prior to the use of this information for purposes other than for submitting diagnosis codes to Dynacare. This is particularly important since information is often affected by ongoing developments.

Medicare Medical Necessity

The Centers for Medicare and Medicaid Services (CMS) requires Medicare carriers to establish policies to ensure the medical necessity of services being paid for by the Medicare program. CMS itself established national policies and, effective November 25, 2002, implemented the National Coverage Determinations (NCDs). Carriers will approve payment only for those particular test procedures when they have determined them to be medically necessary for the patient. As a result, a claim submitted for payment of a test on a local or national list without a specific diagnosis code (ICD-9) that indicates medical necessity based upon the local or national policies will result in denial of payment for these services. These charges would then be billed to the client account at current Medicare rates. This policy applies to all Medicare Part B providers of clinical laboratory services.

CMS in conjunction with the Public Health Service presented guidelines for diagnosis coding. In part these guidelines state:

- Diagnosis codes (ICD-9s) are to be used at their highest level of specificity, e.g.,
- Assign 3-digit codes only if there are no 4-digit codes within that code category,
 - Assign 4-digit codes only if there is no 5-digit subclassification for that category, and
 - Assign the 5-digit subclassification code for those categories where it exists.

ICD-9 is composed of codes with either 3, 4 or 5 digits. Codes with 3 digits are included in ICD-9 as stand-alone codes or as the heading of a category of codes that are further subdivided by the use of 4th or 5th digits which provide greater specificity.

The local Medicare carrier, Wisconsin Physician's Services, has established specific prepayment medical necessity documentation requirements for certain laboratory tests. These local tests plus the national ones are listed on the following pages. If you have any questions regarding the policies listed in this guide, please contact the Wisconsin Physician's Services Medicare Part B office at 866-359-1599.

Wisconsin Physician's Services will not pay for the listed tests unless the claim is accompanied by an appropriate diagnostic code. For your convenience, we have developed this booklet from information published by Wisconsin Physician's Services or CMS to provide you with a list of medically acceptable diagnostic codes for each of these tests.

So that we can properly bill the appropriate party or carrier, we ask that you include an ICD-9 diagnosis code on the test request form when ordering each of these tests for beneficiaries. We do ask that you include the specific ICD-9 code(s) rather than a descriptive diagnosis on each patient. It is critical that the diagnosis codes that you provide are consistent with those documented in the patient's record.

Determining Necessity of Advance Beneficiary Notice (ABN) Completion*

- 1. Diagnose.** Determine your patient's diagnosis.
- 2. Document.** Write the diagnosis code(s) on the front of the requisition.
- 3. Verify.** Determine if the laboratory test(s) ordered for the patient is subject to Local Coverage Determination or National Coverage Determination. This information can be located in the policies published by the local Medicare carrier, CMS, or this guide provided by your Dynacare representative.
- 4. Review.** If the diagnosis code for your patient **does not** meet the medical necessity requirements set forth by Medicare or the test(s) is being performed more frequently than Medicare allows, an ABN should be completed.

*An ABN should be completed for all tests that are considered investigational (experimental or for research use) by Medicare.

Payment Denials and Advance Beneficiary Notices

The Medicare program will allow the laboratory to bill the patient for denied limited coverage services only if an Advance Beneficiary Notice (ABN) is completed, signed and dated by the patient, and forwarded to the laboratory prior to testing. Please provide the signed ABN with the original order. It is the physician's responsibility to ensure that the beneficiary receives and signs an ABN to accept financial responsibility if Medicare does not pay for these services.

ABNs may be obtained from your Dynacare representative.

How to Complete an Advance Beneficiary Notice (ABN)

Medicare is very specific in requiring that all of the information included on the ABN be completed. Additionally, Dynacare requests that the specimen number or bar code label be included on the form. To be valid an ABN must:

1. Be executed on the CMS approved ABN form (CMS-R-131)
2. Identify the Medicare Part B Beneficiary and Medicare Identification Number as it appears on the patient's red, white and blue Medicare card
3. Indicate the procedure(s) which may be denied within the relevant reason column
4. Have 'Option 1,' 'Option 2' or 'Option 3' designated by the beneficiary
5. Be signed **and** dated by the beneficiary or his/her designee **prior to** the service being rendered

Policy Updates

Dynacare will continue to provide you with information regarding specific coverage limitation policies of the local Medicare carrier and CMS, such as when new ones are issued or existing policies are changed or clarified.

Although all health care providers are being affected by these types of policies, we are very sensitive to the challenges these changes bring to you and your patients. Please be assured that we will continue to work to lessen the impact upon you and your patients.

Contact your local billing representative if you have questions regarding this information.

Allergy Testing

82785, 83518, 86001, 86003, 86005, 86343

In-vitro allergen specific IgE testing is limited to the following:

- A. Direct skin testing (95024) is not possible due to extensive dermatitis, dermographism, ichthyosis, generalized eczema or the necessary continued use of H-1 blockers (antihistamines), or in the rare patient with a persistent unexplained negative histamine control.
- B. Testing in patients who have been receiving long-acting antihistamines, tricyclic antidepressants, beta-blockers or medications that may put the patient at undue risk if they are discontinued.
- C. Testing of uncooperative patients with mental or physical impairments.
- D. The evaluation of cross-reactivity between insect venoms;
- E. As adjunctive laboratory tests for disease activity of allergic bronchopulmonary aspergillosis and certain parasitic diseases; and
- F. When clinical history suggests an unusually greater risk of anaphylaxis from skin testing than usual (e.g., when an unusual allergen is not available as a licensed skin test extract).

Twelve (12) allergens per panel are used but no more than 2 panels/beneficiary over a 12-month period are allowed. The medical necessity of more tests must be documented in the patient's record and be available to the contractor upon request.

Total Serum IgE (82785, 83518) is covered for follow-up of bronchopulmonary aspergillosis and it may be necessary to diagnose atopy in small children. It is also covered in association with the drug Omalizumab, Xolair (the patient's pretreatment serum IgE level and body weight are used to determine doses and dosing frequency). It is not appropriate in most general allergy testing. Instead, individual IgE tests are performed against a specific antigen.

Quantitative multi-allergen screen (86005) is a non-specific screen that does not identify a specific antigen. It is a screening tool and therefore not covered by Medicare.

The following tests are considered not medically necessary:

Blood, Urine or Stool Micro-Nutrient Assessments
 Qualification of Nutritional Assessments
 IgG (ELISA) Tests - 86001
 Environmental Cultures and Chemicals
 Live Cell Analysis
 Passive Transfer
 Rebeck Skin Window
 Leukocyte Histamine Release - 86343
 Metabolic Assessments
 General Immune System Assessments
 Secretory IgA (Saliva)
 Qualitative Multi-Allergen Screen - 86005
 Food Allergenic Extract Immunotherapy
 Cytotoxic Food Testing

*Blood Glucose Testing 82947, 82948, 82962

Indications and Limitations of Coverage:

Frequent home blood glucose testing by diabetic patients should be encouraged. In stable, non-hospitalized patients unable or unwilling to do home monitoring, it may be necessary to measure quantitative blood glucose up to 4 times a year. Depending upon patient's age, type of diabetes, complications, degree of control, and other co-morbid conditions, more frequent testing than 4 times a year may be reasonable and necessary. In patients presenting nonspecific signs, symptoms, or diseases not normally associated with disturbances in glucose metabolism, a single blood glucose test may be medically necessary. Repeat testing may not be indicated unless abnormal results are found or there is a change in clinical condition. If repeat testing is performed, a diagnosis code (e.g., diabetes) should be reported to support medical necessity. However, repeat testing may be indicated where results are normal in patients with conditions of a continuing risk of glucose metabolism abnormality (e.g., monitoring glucocorticoid therapy).

Carcinoembryonic Antigen (CEA)*82378****Indications and Limitations of Coverage:**

In following patients who have had treatment for colorectal carcinoma, ASCO guideline suggests that if resection of liver metastasis would be indicated, it is recommended that post-operative CEA testing be performed every two to three months in patients with initial stage II or stage III disease for at least two years after diagnosis. However, it may be proper to order the test more frequently in certain situations, for example, when there has been a significant change from prior CEA level or a significant change in patient status which could reflect disease progression or recurrence.

Serum CEA determinations are generally not indicated more frequently than once per chemotherapy treatment cycle for patients with metastatic solid tumors which express CEA or every two months post-surgical treatment for patients who have had colorectal cancer.

Testing with a diagnosis of an in situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case the test may be repeated once.

*Cardiovascular Disease Screening

80061, 82465, 83718, 84478

Effective January 1, 2005, the cardiovascular screening blood tests covered by Medicare include the following:

- Total Cholesterol Test
- Cholesterol Test for High Density Lipoproteins
- Triglycerides Test

NOTE: The beneficiary must fast for 12 hours prior to testing. Other cardiovascular screening blood tests remain non-covered.

Medicare provides coverage of cardiovascular screening blood tests for all asymptomatic beneficiaries every 5 years (i.e., at least 59 months after the last covered screening tests). The physician or qualified non-physician practitioner treating the beneficiary must order the screening blood tests for the purpose of early detection of cardiovascular disease. The beneficiary must have no apparent signs or symptoms of cardiovascular disease.

When the cardiovascular disease screening blood test is performed as a panel (80061), the panel must include the following:

- Cholesterol, Serum, Total (82465)
- Lipoprotein, Direct Measurement, High Density Cholesterol (HDL Cholesterol) (83718)
- Triglycerides (84478)

Circulating Tumor Cell Marker Assays

0279T, 0280T

Utilization Guidelines:

Frequency

- Baseline – limited to once prior to initiation of tumor-type specific chemotherapy.
- Follow-up during chemotherapy treatment – repeat every 4-6 weeks
- Surveillance with no chemotherapy treatments – repeat every 4-6 weeks

*Collagen Cross Links, Any Method

82523

Indications and Limitations of Coverage:

Because of significant specimen to specimen collagen crosslink physiologic variability (15-20%), current recommendations for appropriate utilization include: one or two base-line assays from specified urine collections on separate days; followed by a repeat assay about three months after starting anti-resorption therapy; followed by a repeat assay in 12 months after the three-month assay; and thereafter not more than annually, unless there is a change in therapy in which circumstance an additional test may be indicated three months after the initiation of new therapy.

*Colorectal Cancer Screening 82270, G0328

Fecal Occult Blood Tests (FOBT) effective for services performed on or after January 1, 2004:

Medicare covers one screening FOBT per annum for the early detection of colorectal cancer. This means that Medicare will cover one guaiac-based (gFOBT) or one immunoassay-based (iFOBT) at a frequency of every 12 months; i.e., at least 11 months have passed following the month in which the last covered screening FOBT was performed, for beneficiaries aged 50 years and older. This screening requires a written order from the beneficiary's attending physician. ("Attending physician means a doctor of medicine or osteopathy (as defined in 1861(r)(1) of the Social Security Act) who is fully knowledgeable about the beneficiary's medical condition, and who would be responsible for using the results of any examination performed in the overall management of the beneficiary's specific medical problem.)

*Cytogenetic Studies 88230-88299

*Diabetes Screening Tests 82947, 82950, 82951

Effective for services provided on or after January 1, 2005, Medicare provides coverage of diabetes screening tests for beneficiaries in the risk group listed below or those diagnosed with pre-diabetes.

The diabetes screening blood tests covered by Medicare include the following:

- A fasting blood glucose test
- AND**
- A post-glucose challenge test; not limited to
 - An oral glucose tolerance test with a glucose challenge of 75 grams of glucose for non-pregnant adults
- OR**
- A 2-hour post-glucose challenge test alone

To be eligible for the diabetes screening tests, beneficiaries must have any of the following risk factors or at least two of the following characteristics:

Beneficiaries are considered at risk for diabetes if they have any of the following risk factors:

- Hypertension,
- Dyslipidemia,
- Obesity (a body mass index equal to or greater than 30kg/m²), or
- Previous identification of elevated impaired fasting glucose or glucose tolerance.

OR

Beneficiaries who have a risk factor consisting of at least two of the following characteristics:

- Overweight (a body mass index greater than 25 but less than 30kg/m²),
- Family history of diabetes,
- Age of 65 or older, or
- A history of gestational diabetes mellitus, or delivery of a baby weighing greater than 9 lbs.

Medicare provides coverage for diabetes screening tests with the following frequency:

Beneficiaries diagnosed with pre-diabetes

Medicare provides coverage for a maximum of 2 diabetes screening tests within a 12-month period (but not less than 6 months apart).

Beneficiaries previously tested but not diagnosed as pre-diabetic or who have never been tested

Medicare provides coverage for 1 diabetes screening test within a 12-month period (i.e., at least 11 months have passed following the month in which the last Medicare-covered diabetes screening test was performed) for beneficiaries who were previously tested and were not diagnosed with pre-diabetes, or who have never been tested.

Medicare provides coverage for 1 diabetes screening as a Medicare Part B Benefit after a referral from a physician or qualified non-physician practitioner for an individual at risk for diabetes. The beneficiary will pay nothing for this screening (there is no coinsurance or copayment and no deductible for this benefit).

*Digoxin Therapeutic Assay 80162

Indications and Limitations of Coverage:

The value of obtaining regular serum digoxin levels is uncertain, but it may be reasonable to check levels once yearly after a steady state is achieved. In addition it may be reasonable to check the level if:

- Heart failure status worsens;
- Renal function deteriorates;
- Additional medications are added that could affect the digoxin level; or
- Signs or symptoms of toxicity develop.

Steady state will be reached in approximately 1 week in patients with normal renal function, although 2-3 weeks may be needed in patients with renal impairment. After changes in dosages or the addition of a medication that could affect the digoxin level, it is reasonable to check the digoxin level one week after the change or addition. Based on the clinical situation, in cases of digoxin toxicity, testing may need to be done more than once a week.

*Fecal Occult Blood

82272

Limitations of Coverage:

The FOBT is reported once for the testing of up to three separate specimens (comprising either one or two tests per specimen).

In patients who are taking non-steroidal anti-inflammatory drugs and have a history of gastrointestinal bleeding but no other signs, symptoms, or complaints associated with gastrointestinal blood loss, testing for occult blood may generally be appropriate no more than once every three months.

When testing is done for the purpose of screening for colorectal cancer in the absence of signs, symptoms, conditions, or complaints associated with gastrointestinal blood loss, report the HCPCS code for colorectal cancer screening; fecal-occult blood test, 1-3 simultaneous determinations should be used.

Indications and Limitations of Coverage and/or Medical Necessity

HIV Infection:

The clinical status of an HIV-Infected patient can be monitored by the analysis of the surface antigens CD4 and CD8. This information can contribute to a staging as well as medical management for that individual (e.g., the need for drug therapy or prophylaxis). Monitoring would be considered appropriate no greater in frequency than once every 3 months. When a patient is stable, especially during the long period of clinical latency, assays would be appropriate at a frequency less often. When the patient has an acute problem and/or therapy change, it may be necessary to perform the test at an increased frequency.

*Gamma Glutamyltransferase (GGT) 82977

Indications and Limitations of Coverage:

When used to assess liver dysfunction secondary to existing non-hepatobiliary disease with no change in signs, symptoms, or treatment, it is generally not necessary to repeat a GGT determination after a normal result has been obtained unless new indications are present.

If the GGT is the only "liver" enzyme abnormally high, it is generally not necessary to pursue further evaluation for liver disease for this specific indication.

When used to determine if other abnormal enzyme tests reflect liver abnormality rather than other tissue, it generally is not necessary to repeat a GGT more than one time per week. Because of the extreme sensitivity of GGT as a marker of cytochrome oxidase induction or cell membrane permeability, it is generally not useful in monitoring patients with known liver disease.

***Glycated Hemoglobin/Glycated Protein**
83036, 82985

Indications and Limitations of Coverage:

It is not considered reasonable and necessary to perform glycated hemoglobin tests more often than every three months on a controlled diabetic patient to determine whether the patient's metabolic control has been on average within the target range. It is not considered reasonable and necessary for these tests to be performed more frequently than once a month for diabetic pregnant women. Testing for uncontrolled type one or two diabetes mellitus may require testing more than four times a year.

Many methods for the analysis of glycated hemoglobin show significant interference from elevated levels of fetal hemoglobin or by variant hemoglobin molecules. When the glycated hemoglobin assay is initially performed in these patients, the laboratory may inform the ordering physician of a possible analytical interference. Alternative testing, including glycated protein, for example, fructosamine, may be indicated for the monitoring of the degree of glycemic control in this situation. It is therefore conceivable that a patient will have both a glycated hemoglobin and glycated protein ordered on the same day. This should be limited to the initial assay for glycated hemoglobin, with subsequent exclusive use of glycated protein.

These tests are not considered to be medically necessary for the diagnosis of diabetes.

ICD-9-CM codes that meet medical necessity guidelines for the following heavy metals have not been identified by WPS:

- Boron
- Phosphorous
- Silica (CPT Code 84285)
- Strontium
- Sulfur
- Uranium
- Vanadium

Helicobacter Pylori (H. Pylori)

83009, 83013, 83014, 86677, 87338, 87339

Note: In addition to the above list, CPT codes that are not definitionally specific for H. Pylori testing, but are used for the tests in this policy, are subject to the limitations of this policy.

Utilization Guidelines

H. Pylori testing should not be repeated any sooner than eight weeks from the previous H. Pylori testing.

ICD-9 codes that Support Medical Necessity for CPT Codes:

83009, 83013, 83014, 86677, 87338, 87339

*Human Immunodeficiency Virus (HIV) Infection, Screening G0432, G0433, G0435

Indications and Limitations of Coverage:

CMS determines that the evidence is adequate to conclude that screening for HIV infection is reasonable and necessary for early detection of HIV. Therefore, CMS will cover both standard and FDA-approved HIV rapid screening tests for:

- One, annual voluntary HIV screening of Medicare beneficiaries at increased risk for HIV infection per USPSTF guidelines and in accordance with Pub. 100-03, National Coverage Determinations Manual (NCD), sections 190.14 and 210.7, and Pub. 100-04, Medicare Claims Processing Manual (CPM), chapter 18, section 130.

Note: Eleven full months must elapse following the month in which the previous test was performed in order for the subsequent test to be covered.

- Three voluntary HIV screenings of pregnant Medicare beneficiaries: (1) when the diagnosis of pregnancy is known, (2) during the third trimester, and (3) at labor, and in accordance with Pub. 100-03 and Pub. 100-04, as noted above.

Note: Three tests will be covered for each term of pregnancy beginning with the date of the 1st test.

Note: The guidelines upon which this policy is based contains 8 increased-risk criteria. The first 7 require the presence of both ICD-9 diagnosis codes V73.89 and V69.8 for the claim to be paid. The last criterion, which covers persons reporting no increased risk factors, only requires ICD-9 V73.89 for the claim to be paid.

Note: Patients with any known prior diagnosis of HIV-related illness are not eligible for this screening test.

Alpha Sort

V69.8*	Other Problems Related to Lifestyle
V73.89	Special Screening Examination for Other Specified Viral Diseases
V22.0**	Supervision of Normal First Pregnancy
V22.1**	Supervision of Other Normal Pregnancy
V23.9**	Supervision of Unspecified High-Risk Pregnancy

*ICD-9-CM code V69.8 must accompany V73.89 when increased risk factors are reported.

**ICD-9-CM codes V22.0, V22.1, and V23.9 must accompany V73.89 for pregnant female Medicare beneficiaries.

Human Immunodeficiency Virus (HIV) Testing (Diagnosis)*86689, 86701-86703, 87390, 87391, 87534, 87535, 87537, 87538****Indications and Limitations of Coverage:**

If initial serologic tests confirm an HIV infection, repeat testing is not indicated.

If initial serologic tests are HIV EIA negative and there is no indication for confirmation of infection by viral RNA detection, the interval prior to retesting is 3-6 months.

Lipids*80061, 82465, 83700, 83701, 83704, 83718, 83721, 84478****Indications and Limitations of Coverage:**

When monitoring long-term anti-lipid dietary or pharmacologic therapy and when following patients with borderline high total or LDL cholesterol levels, it may be reasonable to perform the lipid panel annually. A lipid panel at a yearly interval will usually be adequate while measurement of the serum total cholesterol or a measured LDL should suffice for interim visits if the patient does not have hypertriglyceridemia.

Any one component of the panel or a measured LDL may be reasonable and necessary up to six times the first year for monitoring dietary or pharmacologic therapy. More frequent total cholesterol HDL cholesterol, LDL cholesterol and triglyceride testing may be indicated for marked elevations or for changes to anti-lipid therapy due to inadequate initial patient response to dietary or pharmacologic therapy. The LDL cholesterol or total cholesterol may be measured three times yearly after treatment goals have been achieved.

If no dietary or pharmacological therapy is advised, monitoring is not necessary.

When evaluating non-specific chronic abnormalities of the liver (for example, elevations of transaminase, alkaline phosphatase, abnormal imaging studies, etc.), a lipid panel would generally not be indicated more than twice per year.

*Pap Smears, Screening

G0123, G0124, G0141, G0143, G0144, G0145, G0147, G0148, P3000, P3001

Medicare's coverage of the screening Pap test was created as a result of the implementation of the Omnibus Budget Reconciliation Act of 1989 (OBRA 1989). This Act authorized Medicare to begin covering screening Pap tests provided to female beneficiaries on or after July 1, 1990.

Risk Factors

High risk factors for cervical and vaginal cancer include the following:

- Early onset of sexual activity (under 16 years of age),
- Multiple sexual partners (5 or more in a lifetime),
- History of a sexually transmitted disease [including human papillomavirus (HPV) and/or Human Immunodeficiency Virus (HIV) infection],
- Fewer than 3 negative Pap tests or no Pap test within the previous 7 years, and
- DES (diethylstilbestrol)-exposed daughters of women who took DES during pregnancy.

Coverage Information

Medicare provides coverage of a screening Pap test for all female beneficiaries. A doctor of medicine or osteopathy or other authorized practitioner (i.e., a certified nurse midwife, physician assistant, nurse practitioner, or clinical nurse specialist), who is authorized under State law to perform the examination must order and collect the screening Pap test. Frequency of coverage is provided as follows:

Covered once every 12 months:

Medicare provides coverage of a screening Pap test annually (i.e., at least 11 months have passed following the month in which the last Medicare-covered Pap test was performed) for female beneficiaries who meet one of the following criteria:

- There is evidence (on the basis of her medical history or other findings) that the woman is of childbearing age and has had an examination that indicated the presence of cervical or vaginal cancer or other abnormalities during any of the preceding 3 years, or
- There is evidence that the woman is in one of the high risk categories (previously identified) for developing cervical or vaginal cancer, or has other specified personal history presenting hazards to health.

Covered once every 24 months:

Medicare provides coverage of a screening Pap test for all asymptomatic non-high risk female beneficiaries every 2 years (i.e., at least 23 months have passed following the month in which the last covered screening Pap test was performed).

NOTE: The term "woman of childbearing age" means a woman who is premenopausal, and has been determined by a physician, or qualified practitioner, to be of childbearing age, based on her medical history or other findings.

Pap Smears, Screening*G0123, G0124, G0141, G0143, G0144, G0145, G0147, G0148, P3000, P3001**

Medicare provides coverage for a Pap test as a Medicare Part B benefit. The coinsurance or copayment applies for the Pap test collection; however, there is no Medicare Part B deductible for Pap test collection. The beneficiary will pay nothing for the Pap laboratory test (there is no deductible and no coinsurance or copayment for the Pap laboratory test).

Low Risk**Alpha Sort**

V72.31 Routine Gynecological Examination
NOTE: This diagnosis should only be used when the provider performs a full gynecological examination.

V76.2 Special Screening for Malignant Neoplasms, Cervix
 V76.49 Special Screening for Malignant Neoplasms, Other Sites
NOTE: Provider use this diagnosis for women without a cervix.

V76.47 Special Screening for Malignant Neoplasms, Vagina

*Prostate Cancer Screening Test G0103

Screening Prostate Specific Antigen Tests

Screening prostate specific antigen tests are covered at a frequency of once every 12 months for men who have attained age 50 (at least 11 months have passed following the month in which the last Medicare-covered screening prostate specific antigen test was performed). Screening prostate specific antigen tests (PSA) means a test to detect the marker for adenocarcinoma of prostate. PSA is a reliable immunocytochemical marker for primary and metastatic adenocarcinoma of prostate. This screening must be ordered by the beneficiary's physician or by the beneficiary's physician assistant, nurse practitioner, clinical nurse specialist, or certified nurse midwife (the term "attending physician" is defined in §1861(r)(1) of the Act to mean a doctor of medicine or osteopathy and the terms "physician assistant, nurse practitioner, clinical nurse specialist, or certified nurse midwife" are defined in §1861(aa) and §1861(gg) of the Act) who is fully knowledgeable about the beneficiary's medical condition, and who would be responsible for using the results of any examination (test) performed in the overall management of the beneficiary's specific medical problem.

V76.44 Special Screening for Malignant Neoplasms, Prostate

Numeric Sort

V76.44

*Prostate Specific Antigen 84153

Indications and Limitations of Coverage:

Generally, for patients with lower urinary tract signs or symptoms, the test is performed only once per year unless there is a change in the patient's medical condition. Testing with a diagnosis of in situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case the test may be repeated once.

*Prothrombin Time 85610

Indications and Limitations of Coverage:

When an ESRD patient is tested for PT, testing more frequently than weekly requires documentation of medical necessity.

The need to repeat this test is determined by changes in the underlying medical condition and/or the dosing of warfarin. In a patient on stable warfarin therapy, it is ordinarily not necessary to repeat testing more than every two to three weeks. When testing is performed to evaluate a patient with signs or symptoms of abnormal bleeding or thrombosis and the initial test result is normal, it is ordinarily not necessary to repeat testing unless there is a change in the patient's medical status.

Serum Iron Studies*82728, 83540, 83550, 84466****Indications and Limitations of Coverage:**

If a normal serum ferritin level is documented, repeat testing would not ordinarily be medically necessary unless there is a change in the patient's condition, and ferritin assessment is needed for the ongoing management of the patient. For example, a patient presents with new onset insulin-dependent diabetes mellitus and has a serum ferritin level performed for the suspicion of hemochromatosis. If the ferritin level is normal, the repeat ferritin for diabetes mellitus would not be medically necessary.

When an End Stage Renal Disease (ESRD) patient is tested for ferritin testing more frequently than every three months, documentation of medical necessity is required.

Thyroid Testing*84436, 84439, 84443, 84479****Indications and Limitations of Coverage:**

Testing may be covered up to two times a year in clinically stable patient; more frequent testing may be reasonable and necessary for patients whose thyroid therapy has been altered or in whom symptoms or signs of hyperthyroidism or hypothyroidism are noted.

*Tumor Antigen by Immunoassay CA125 86304

Indications and Limitations of Coverage:

A CA 125 level may be obtained as part of the initial pre-operative work-up for women presenting with a suspicious pelvic mass to be used as a baseline for purposes of post-operative monitoring. Initial declines in CA 125 after initial surgery and/or chemotherapy for ovarian carcinoma are also measured by obtaining three serum levels during the first month post treatment to determine the patient's CA 125 half-life, which has significant prognostic implications.

CA 125 levels are again obtained at the completion of chemotherapy as an index of residual disease. Surveillance CA 125 measurements are generally obtained every three months for two years, every six months for the next three years, and yearly thereafter. CA 125 levels are also an important indicator of a patient's response to therapy in the presence of advanced or recurrent disease. In this setting, CA 125 levels may be obtained prior to each treatment cycle.
